Bloomberg Barclays Global Aggregate Enhanced Yield Index Rebalance [Apr 2019]

Glossary:

Global Agg Composite is the subset of the six major currencies (AUD, CAD, EUR, GBP, JPY and USD) of the Bloomberg Barclays Global Aggregate Index.

Yield to Worst (YTW) is the lowest potential yield that can be received on a bond without the issuer actually defaulting. When a bond is callable, the yield to worst is the lower yield of yield to maturity and yield to call.

Hedged Yield is the resulting index yield after hedging from local to base currency calculated using differences in government short rates.

Duration is a measure of the sensitivity of the price (the value of principal) of a fixed income investment to a change in interest rates. Effective duration is a calculation used to approximate the actual, modified duration of a callable bond. It takes into account that future interest rate changes will affect the expected cash flows for a callable bond.

Basis Points (bps) is 1/100th of 1 percent

Investors should carefully consider the investment objectives, risks, charges and expenses of the Funds before investing. To obtain a prospectus containing this and other important information, please call 866.909.9473, or visit WisdomTree.com to view or download a prospectus. Investors should read the prospectus carefully before investing.

There are risks associated with investing, including possible loss of principal. Fixed income investments are subject to interest rate risk; their value will normally decline as interest rates rise. Fixed income investments are also subject to credit risk, the risk that the issuer of a bond will fail to pay interest and principal in a timely manner or that negative perceptions of the issuer's ability to make such payments will cause the price of that bond to decline. Investing in mortgage- and asset-backed securities involves interest rate, credit, valuation, extension and liquidity risks and the risk that payments on the underlying assets are delayed, prepaid, subordinated or defaulted on. The Fund uses various strategies to attempt to minimize the impact of changes in the value of the non-U.S. currencies against the U.S. dollar. These strategies may not be successful. Derivatives used by the Fund to offset its exposure to foreign currencies represented in the Index may not perform as intended. There can be no assurance that the Fund's hedging transactions will be effective. Due to the investment strategy of the Fund, it may make higher capital gain distributions than other ETFs. Please read the Fund's prospectus for specific details regarding the Fund's risk profile.
