
FROM OUR JAPAN STRATEGIST ROUNDTABLE: A POTENTIAL “RETURN REVOLUTION” DISCUSSION WITH NAOKI KAMIYAMA

Jeremy Schwartz – Global Chief Investment Officer
02/19/2014

WisdomTree has compiled a [Japan Strategist roundtable](#)—a compilation of views from three of the most widely followed Japan investment strategists. In separate one-on-one interviews, we asked these strategists to share their views on Japan’s equity markets, the economy, government initiatives and the currency. The post below features a discussion with Naoki Kamiyama, Head of Japan Equity Strategy at Bank of America Merrill Lynch, and some of his long-term thinking for Japanese equities, along with sectors he likes over the shorter-term. *Let’s talk about your “Return Revolution” report, which is for Japan ROE to reach 15% in 2019 and the TOPIX to exceed 2,500 in 2017.* Naoki Kamiyama: The most important point—the reasons of low [margins](#) in Japan. Quite many believe low margins are caused by labor market structure, lifetime employment, the seniority system and high fixed costs due to social structure. My point is that this labor market is not a big issue. If low margins really came from labor costs, during the 2002–2007 global economic expansion, Japan should have been the highest-margin country in the world. It was not. My conclusion: The primary issue is, pricing strategy is wrong in Japan. Companies have preferred sales volume over profitability. Once Japan’s management changes its mindset, we can change quickly. That’s why I called the report “Return Revolution.” We can change suddenly. We do not have to stress labor market reform—we need to change the mindset of the corporate management and pricing strategies. As long as corporates can sell higher prices and higher margins, they should stay in a business. But once the company loses competitiveness, companies need to move on. Flexibility is the key there. Japan can do that, we can change. But I am not sure we are changing yet. This would be a bull scenario for this mindset change. Once management changes its thinking, we can see U.S. or European levels of margins in the next five years. *What factors led to this type of pricing strategy?* Naoki Kamiyama: Banking-led governance of companies was a historical tradition. Banks do not need growth. Banks want companies to emphasize size, reliability of payback, stability. Equity holders need growth and profitability. Banking governance was strong from the 1950s to the 1960s up to the banking crisis in the late 1990s. Many management teams suffered from banks’ involvement in management. Now things have changed. After 1998, banks have gotten weaker, management paid back loans and management is cash rich and doesn’t care about banks. But management doesn’t care about profitability metrics yet. They keep cash on the balance sheet. *What are catalysts for this return revolution?* Naoki Kamiyama: The [stewardship code](#) is one. The stewardship code was introduced in the United Kingdom. I think this is an important catalyst to change governance from banking relationship to equity holders. It is quite natural to adopt a stockholder way of thinking due to the aging population and globalization. Intentional growth is really important and more important than before. The change in mindset can be provided by stockholders’ communications using the stewardship code for institutional investors and management to be more responsive to

stockholders' governance over the next several years. There are good signs. Some companies are being more conscious of profitability. Size is not just the most important thing, profitability is also the key. The trends are going the right way. I am not sure of the speed at which this will occur, but this is a focus point for the next several years. *Kamiyama-san, thanks for the big-picture take on the market and your outlook. What are your favored positions for 2014?* Naoki Kamiyama: I am quite positive on exporters in the first half of the year—technology and autos—on the back of a weaker yen as well as expanding sales volume because of a global recovery. In the Technology sector, we also have some structural changes from the [micro](#) perspective, like a reduction in oversupply. In semiconductors or consumer electronics, that should be beneficial to margins. In the second half, I have a bigger expectation for inflation. Expectations for higher inflation are good for real estate, banks and other financials. The second half I thus see as good for domestic industries—like retail and others. But our central focus should be on financials, with better loan growth. [Interest rates](#) are starting to go up, and people are trying to borrow more money—to build houses or buy condos before the interest rates increase too much. So far, analysts are not that optimistic yet for the financials, including real estate, but in the second half, domestic industries and financials will be supporting the market. *You also have a sector model. How does that model work?* Naoki Kamiyama: My sector model is quite short-term—three months—driven and not a year outlook. The model is quite systematic. The Japan Cycle Indicator (JCI) is quite important as a [top-down](#) analysis tool to favor sectors. The JCI has six inputs; the most important one is U.S. employment numbers, but also included in it are U.S. and Japanese interest rates, foreign exchange rates, [volatility](#) indicators and earnings revisions. This month, U.S. employment was much weaker than expected, so there was a down trend in the Cycle Indicator. From that perspective, we are negative to cyclical—sensitive sectors—so sectors like steel, which are [correlated](#) to cyclical. Steel was thus very negatively ranked by the JCI indicator. Autos today are quite well-balanced in both top-down model and my [bottom-up](#) model—and it is my most preferred sector. I don't see that changing in the short term. Banks or real estate are not highly ranked yet, because we don't have much confidence in the inflationary environment yet. We think this will be in the second half of the year—this is related to interest rate sensitivity. Once we get more confidence in inflation, interest rate ranking will move up, and then banks and real estate will go up. Wage increases are a starting point for inflation expectations. Wage season is coming in April. If wages go up, as many expect, more people are likely to go out and buy houses, condos, real estate and more businesses to expand. **We very much thank Naoki Kamiyama for his participation in our roundtable. Important Risks Related to this Article

Foreign investing involves special risks, such as risk of loss from currency fluctuation or political or economic uncertainty. Investments focused in Japan are increasing the impact of events and developments associated with the region, which can adversely affect performance. Investments focusing on certain sectors and/or smaller companies increase their vulnerability to any single economic or regulatory development. This may result in greater share price volatility. Fixed income investments are subject to interest rate risk; their value will normally decline as interest rates rise. Fixed income investments are also subject to credit risk, the risk that the issuer of a bond will fail to pay interest and principal in a timely manner, or that negative perceptions of the issuer's ability to make such payments will cause the price of that bond to decline. DEFINITIONS

Return on Equity (ROE): Measures a corporation's profitability by revealing how much profit a company generates with the money shareholders have invested.

Tokyo Stock Price Index (TOPIX): A free float-adjusted market capitalization-weighted index that is calculated based on all the domestic common stocks listed on the Tokyo Stock Exchange First Section.

Margins: Focused on issues impacting the overall economic landscape as opposed to those only impacting individual companies.

Stewardship code: Aims to enhance the quality of engagement between asset managers and companies to help improve the long-term experience of shareholders.

Micro: Focused on issues impacting individual companies as opposed to those impacting the broader economic landscape.

Interest rates: The rate at which interest is paid by a borrower for the use of money.

Top-down: A method of analysis that involves looking at the "big picture" first and then analyzing the details of smaller components.

Volatility: A measure of the dispersion of actual returns around a particular average level.

Correlation: Statistical measure of how two sets of returns move in relation to each other. Correlation coefficients range from -1 to 1. A correlation of 1 means the two subjects of analysis move in lockstep with each other. A correlation of -1 means the two subjects of analysis have moved in exactly the opposite direction.

Bottom-up: An investment approach that de-emphasizes the significance of economic and market cycles. This approach focuses on the analysis of individual securities.
