
WHAT IS NEW ECONOMY REAL ESTATE AND WHY IS IT IMPORTANT?

Christopher Gannatti — Global Head of Research, Eric Rothman — Portfolio Manager at CenterSquare Investment Management

03/10/2023

[New economy real estate](#) can simply be described as the real estate where other ‘[megatrend](#)’ technologies and innovations occur. These are the physical buildings that house the internet and bio-life science technology; the communication towers that transmit data; and the properties involved in logistics (specifically e-commerce).

It also focuses on the markets and cities where there are high concentrations of innovation and technology; for example, the golden triangle between London, Cambridge and Oxford, the sites of the universities that are encouraging a lot of biotech, life science and medical innovation. Another example is South San Francisco where there is the combination of computer science, [artificial intelligence \(AI\)](#) technology and life science technology. You might also think of Boston, the Shibuya district of Tokyo or Geneva in Switzerland. These markets all have high concentrations of technology industries in their overall economic makeup.

These cities, or areas, house the property types that have the most growth behind them. They are highly specialized, mission-critical properties, and they are in small supply. Therefore, if you own these buildings, in these locations, you have the potential to charge better-than-average rental growth. As such, ‘new economy’ real estate is the ‘best of the best,’ the ‘tip of the spear’ of the real estate market.

It’s worth mentioning that this is not old economy real estate. It doesn’t include much residential or any obsolete office space and it avoids entirely retail assets (that are quickly being replaced in the transition to internet purchases). We have identified the key areas for new economy real estate as:

- Data centers
- Cell phone towers
- Logistics properties
- Biotechnology properties
- Technology properties

The growing need for data centers

We are consuming huge amounts of data and this is increasing every day. Take YouTube, for example. Every minute, over 500 hours of video is uploaded to the video platform.¹

Figure 1: Hours of video uploaded to YouTube every minute (as of February 2023)

Source: Statista, February 2023. Past performance is not indicative of future results.

Over the course of a year, this equates to thousands of years’ worth of content. And the same thing is happening on platforms like TikTok—if you were to sit down and try and watch all of the video content on the internet, from beginning to end, it would take you back to the dinosaurs. That’s how much there is. Global consumption of data has been accelerating at a 30% compound, average annual growth rate for the last decade, and is expected to continue to accelerate at a 30% average annual growth rate.²

This is a huge amount of data and it needs to be processed and stored somewhere—data centers—and so data center demand is also accelerating, fueled by trends like 5G, the internet of things and artificial intelligence. With the emergence of new AI technologies, like ChatGPT, this is only going to grow further.

Greater Connectivity = More Cell Phone Towers

We’re all using our cell phones more and we’re transmitting more data. The big story from a macro perspective focuses on the transition to 5G. This ‘upgrade’ is going to require a lot more antennas and more points of service. We’re currently in the process of building out 5G and, over the next three years, U.S. carriers (and global carriers) are expected to spend a record amount of money building out their networks. That level of investment will directly benefit the owners of telecommunication towers; every time a company puts another antenna on top of an existing antenna, it generates a payment to the owner of that underlying tower. So, we can see there is strong, fundamental demand, driven by this macro trend of us all using our phones more.

Modernizing the Global Supply Chain

E-commerce has grown exponentially, further fueled by the COVID-19 pandemic, which has accelerated the monumental shift from bricks and mortar retail to online shopping. This increase in e-commerce demand is driving demand for logistics, and for space to store, process and distribute consumer products. The facilities or warehouses associated with e-commerce need to be big. To give some perspective, an e-commerce supply chain typically requires three times the amount of warehouse and logistics space as a traditional bricks and mortar supply chain.³ Not only that, but you need the building to be close to consumers—when people place an order on their phone, they expect that product to arrive within a matter of hours, not weeks. But, as we know, there’s not often huge amounts of free space close to cities that house large populations of ‘purchase-loving’ consumers. So, we start to see a very limited supply which, as determined by the basic economic law of supply and demand, leads to increase demand and allows those who own those assets to charge higher prices.

Furthermore, the actual machines within these buildings that facilitate quick processing of packages are unique and relatively scarce. So if you are the owner of these assets you can, to an extent, charge whatever you want. E-commerce

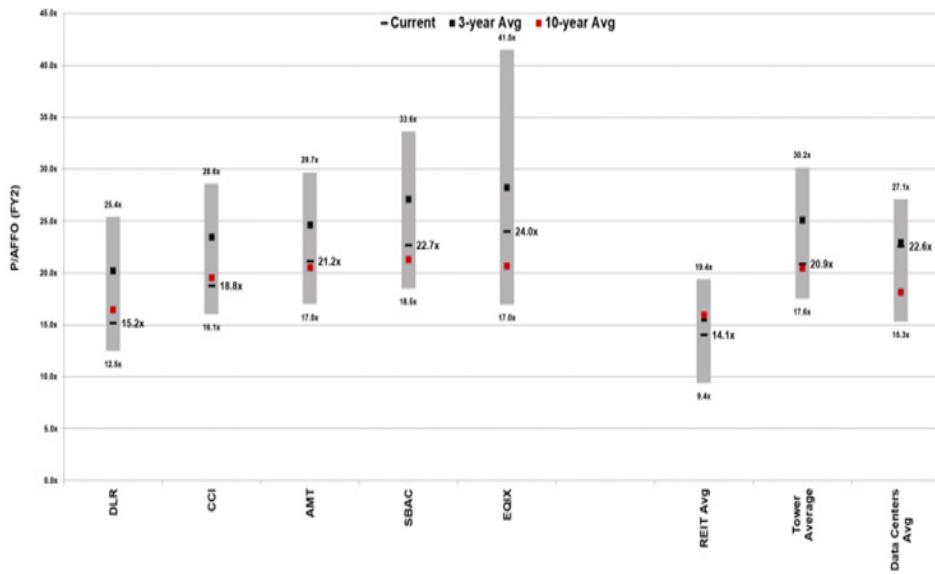

companies don't have much choice but to use these valuable facilities. In fact, in many markets, there is no asking rental rate for that type of asset. They literally put the potential tenants in a room and ask them to bid on the space. This is a unique dynamic and one that we don't see much of in the traditional real estate space.

Why Now for New Economy Real Estate?

The above examples make clear the high level of demand for this type of real estate. But what about supply and, importantly, valuation? Well, by virtue of the recent changes in interest rates and the immediate impact on the public markets and their repricing of all real estate, we have a potentially unique opportunity where the valuations have come down, and come down materially.

Figure 2

Risk/Reward – P/AFFO – FY2

Figure 2 highlights how these multiples have changed over the last decade. What was the high, what was the low, what was the average over the prior three years? Looking at where the multiples sit today, you can see that, in every case, they are at the bottom end of their historical range and well below the average of the last three years. So, from a repricing standpoint, now is potentially a good time to get into these sectors in the public markets, because it's already been repriced.

Anyone looking to make an investment within new economy real estate may consider the [WisdomTree New Economy Real Estate Fund \(WTRE\)](#), which is designed to track the returns of the [CenterSquare New Economy Real Estate Index](#) after fees and expenses. Many of the ideas discussed in this blog are direct areas of focus for this particular Index's methodology.

DEFINITIONS

New economy sectors : High-growth industries that are on the cutting edge of technology and are the driving force of economic growth, such as Information Technology, Health Care and to some degree the consumer-oriented sectors.

Megatrends : A major movement, pattern or trend emerging in the macroenvironment; an emerging force likely to have a significant impact on the kinds of products consumers will wish to buy in the foreseeable future.

Artificial intelligence : machine analysis and decision-making.

CenterSquare New Economy Real Estate Index : A weighted index that consists of global stocks of real estate companies that have material direct and/or indirect exposure to technology, sciences and/or ecommerce related business models and meet specific screening requirements that consider factors including growth, valuation and leverage criteria.
