

All roads lead to a very exciting future of mobility

Published 26 September 2022

Mobeen Tahir

Director, Research

In the classic 1980s film, 'Back to the Future', the protagonists, Dr. Emmett Brown and Marty McFly, travel 30 years into the future. In the year 2015, their DeLorean time machine, which now runs on waste matter, is airborne in what appears to be heavy car traffic in the skies.

Although our skies don't quite look like what was envisioned in the movie, 'Back to the Future' did get two things right. First, cars have found alternative fuels to run on. And second, the technology at our fingertips today bears no resemblance to what was there back in the 80s.

We know that as technology advances, the rate of change increases too. But we don't need another dose of science fiction to imagine the future of automobility. All we must do is observe the megatrends already in motion.

At WisdomTree, we see the future of automobility as connected, autonomous, shared and electrified. This is exciting not just for car and technology enthusiasts, but investors as well.

Connectivity

Imagine you are driving on the motorway. You feel hungry. You verbally ask the car to search for good restaurants along the route, pick the one which optimises between the highest rating and your cuisine preferences, and add a stop on the navigation. This isn't science fiction; some cars with high-tech infotainment systems can do precisely this. The Mercedes Benz User Experience (MBUX) responds to "Hey Mercedes" and uses artificial intelligence to predict your personal habits. The more you drive it, the more likely it will find you a route you will enjoy most. It will also remind you when your next service is due. It knows, after all, how forgetful you can be...

In 2021, there were 236 million connected cars worldwide. A connected car is one that uses the internet to download, as well as upload, data. By 2035, this number could reach 863 million¹.

The connected car brings additional benefits as well. It can update its software automatically, like your mobile phone. This means fewer trips to the workshop. It can also help you monitor critical safety information about the car remotely. This is especially useful for managers who need to maintain entire fleets of cars. Digital dashboards can enable them to monitor their fleet quickly and remotely, instead of checking each car manually.

Autonomous driving

Now, imagine being on the motorway again. Perhaps you don't have enough time to sit at a restaurant, but you could pick something up and eat in your car while driving. Not very safe? Why not let the car drive itself while you enjoy your meal in the backseat and maybe even respond to some urgent emails.

Figure 1: The many flavours of autonomous mobility

Source: WisdomTree, Berylls, Leanval, 2022. VTOL is vertical take-off and landing.

As illustrated in Figure 1, autonomous driving isn't just for the hungry driver in a hurry, it will have a huge impact on all forms of mobility. Logistics is one example. The global drone package delivery market is expected to grow from \$824 million in 2021 to \$11,519 million in 2030, expanding at a compound annual growth rate of over 55%².

Autonomous mobility has many tangible benefits, including improving safety. Currently, approximately 1.3 million people die each year because of road traffic accidents³. Although there are regulatory and psychological barriers to overcome before full automation becomes the norm, assisted and partially automated driving is already making cars safer. As we progress along the continuum of automation, this dreadful statistic might hopefully be reduced.

Moreover, not always requiring humans to do the job will make logistics more efficient and cost effective. The UK, with its recent lorry driver shortage, could certainly have benefitted from automated driving.

Shared mobility

Back to the motorway scenario again. This time, imagine you reach your desired restaurant in a town nearby only to find there is no parking. But what if you don't need to park. You don't own the car anyway. The car drops you off and goes to pick up another passenger. Once you're ready to go, you call another car.

These days when we think of ride-hailing, we think of Uber as the alternative to calling a traditional taxi. But in many crowded cities, shared ownership can reduce the need for people to own cars. This could not only reduce the financial burden on individuals and city planners, but also help the environment.

Figure 2: Cities need to find a way to meet people's individual mobility needs without hurting the environment

Vehicle on demand (carsharing) and **mobility on demand** (ride-hailing) create a marketplace for transportation

This marketplace creates 'positive feedback' through network effects.

Electrification

Let's return to the motorway scenario one last time. This time you hear on the radio how terrible the weather is going to be the following week. As you ponder the state of the planet amid climate change, you feel assured that at least you have ditched your internal combustion engine car in favour of an electric one.

Road transportation accounts for almost 12% of all greenhouse gas emissions⁴. Electrification can, therefore, make a huge difference. A few years ago, electric vehicles were limited to the likes of Tesla and a handful of other car manufacturers. Today, most car makers have rapidly growing ranges of electric models. Electric vehicle sales doubled in 2021 compared to 2020 and reached 6.6 million worldwide. All of this in a year when the automobile industry was faced with semiconductor chip shortages. By 2040, electric vehicles will dominate sales worldwide (see Figure 3 below).

Source: BloombergNEF, as of 01 June 2022. Drivetrains: BEV (battery electric vehicles), PHEV (plug-in hybrid electric vehicles), FCV (fuel cell vehicles), ICE (internal combustion engine vehicles). ICE includes self-charging hybrids. Types: Shared (digital-hailing, taxis, car-sharing and autonomous vehicles operated in a shared fleet), private (privately owned vehicles).

Forecasts are not an indicator of future performance and any investments are subject to risks and uncertainties.

Electrification (that is, making cars that run on lithium-ion batteries) isn't the only innovation car makers are pursuing. Manufacturers are actively exploring alternative fuels like hydrogen. Daimler already has hydrogen fuel cell trucks under testing. Car makers are also innovating with cutting edge technologies like wireless charging. BMW is an example in this space. After all, it will be easier for autonomous cars to park themselves over bays where they can charge wirelessly, rather than finding a way for cables to be connected somehow.

How can investors capture these megatrends?

The automotive ecosystem can be split into five key segments.

1. Original equipment manufacturers – companies developing, manufacturing and selling vehicles.
2. Suppliers – companies developing, manufacturing and selling software, hardware or engineering services for vehicle development.
3. Dealers and aftermarkets – companies buying and selling vehicles or providing platforms for doing so. Likewise, servicing, optimising and repairing vehicles after they have been put into operation.
4. Infrastructure – companies developing, operating, and maintaining the infrastructure required for industry transformation (for example, charging, hydrogen refuelling).

5. Mobility service providers – companies providing mobility services (B2B / B2C)⁵ or providing the platform for a third party to provide mobility services. An exposure across the five segments can help investors capture the megatrend of future mobility.

Expect change. Expect innovation. Expect excitement. The mobility ecosystem is evolving rapidly to meet the changing needs of consumers and cities, and to tackle climate change. And, it is starting to get a lot of attention from investors.

1 As per September 2021 forecasts from Statista.
