

India bull run part II: Household inflows propelling India toward multiple-year bull market

Published 12 September 2017

We recently covered the ongoing structural changes in India that stand to benefit equities in the long run. In this post, we cover a second propeller for Indian equities that we believe will support gains in the market: the inflow from domestic investors.

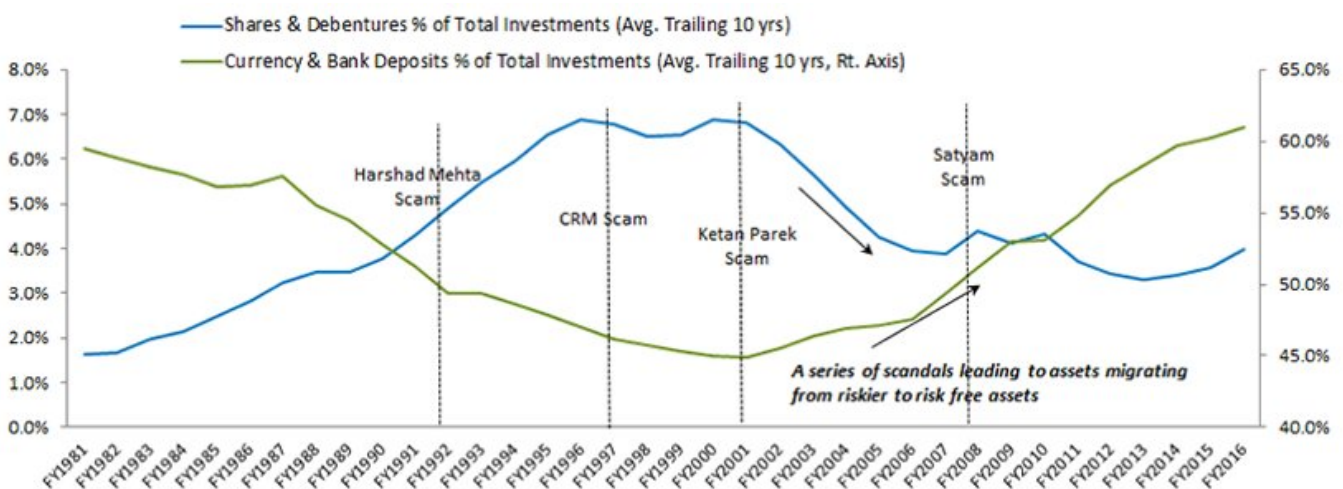

Traditionally, exposure to financial markets has constituted around 6% of the household balance sheet in India. In comparison, the figure in the United States is well above 30%.¹ This is about to change and, in our opinion, sets up India for a strategic bull run.

Great reverse migration from safer assets to market assets

India has a long history of stock markets. The Bombay Stock Exchange was founded in 1875 and is the oldest stock exchange in Asia.² Trading in India is now all-electronic, and the settlement process takes about 48 hours—as fast as any developed market.

However, it has been a long ride. Back in 1990s and early 2000s, loosely regulated markets in India got hit with multiple scandals. This led to the average Mr & Mrs Gandhi pulling out their savings from equities and putting that money in traditionally safer instruments such as cash and bank accounts—a “migration” of Indian household assets.

Market inefficiencies led to migration of household assets from securities to cash and bank deposits

Source: Morgan Stanley. Reserve Bank of India, as of 30/06/2017. Past performance is not indicative of future results. FY stands for Fiscal Year-IE the period used by government for accounting purposes. In India, this is from April 1 through March 1 of next year.

Thus, while India's per capita income boomed five fold from a mere \$247 in 1981 to \$1,380,3 the household investment in stocks did not grow in proportion to income.

As markets matured and became more regulated, this trend gradually changed. What we should now see is a "reverse migration" of household assets from cash and bonds toward equities. Steps encouraging this reverse migration include the following:

- A regulatory body, SEBI,⁴ that has launched a series of stringent market regulations in the last two decades
- A generation that has now grown up under the influence of markets that are much more regulated and audited
- SEBI now mandating all mutual funds to spend .02% of their assets under management on investor education (and thus, an equity asset base of 3,580 billion rupees implies about 700 million rupees spent on investor education⁵)
- Encouraging tax regime with zero taxation for long-term capital gains and a discounted 15% on short-term capital gains⁶

Early effects of domestic investment

Demographics and consumption have been the core pillars of India's economy. However, what we haven't covered is how demographics are likely to fuel the flow into stock markets too.

In 2015, around 25 million new brokerage accounts were opened in India,⁷—higher than ever before! What is even more encouraging is the exponential growth trend. India has one of the most attractive demographic profiles, with nearly two-thirds of the country below 35 years of age.⁸ As memories of inefficient markets fade and the risk appetite of young India increases, we expect a significant shift toward stock market investments.

Young India taking more and more interest in investing

Past performance is not indicative of future results

Early signs of this migration are starting to show. Over the last 10 years, FII's9 invested around \$134 billion in Indian markets, compared to \$50 billion from Indian households.10 A more recent trend shows domestic equity investment picking up faster than FII investment.

Conclusion

As more domestic money comes in, we can probably expect a few consequences:

- A growing market with multiplies indicative of growth and a new influx of demand from young India
- Better insulation from global up/downswings and markets that are more internal
- Strategic market rally that is driven by inward forces
- Increasing market capitalisation causing India's weight in benchmark emerging market indexes to go up.

It is estimated that India's savings will increase fivefold over the next decade and reach over 50 trillion rupees by 2025. Currently, around 6.16% (or around 900 billion rupees in currency terms) of household assets are in risky assets; even if we assume there is no migration and 6.16% stays flat, at 50 trillion rupees it implies 3.08 trillion rupees invested in market assets in the next 8 to 10 years. In other words, that's a market expansion of 2 trillion rupees (\$31 billion), and this is without any increase in risk tolerance.¹¹
