Key Takeaways

- Europe is ramping up defence spending as reliance on US security weakens, with more NATO members hitting spending targets.
- EU nations are exploring new funding methods, including defence bonds and private-sector partnerships, to sustain military investments.
- Defence stocks are surging on record-high order books and strong government commitments, positioning the sector for long-term growth.

The race to bolster European defence capabilities is well underway. Since the invasion of Ukraine, European leaders have intensified calls for increased defence spending. The continent, long reliant on US security guarantees, is now facing a critical inflection point. Recent moves by the US administration to engage with Russia without consulting its European allies or Ukraine have underscored the urgent need for Europe to take charge of its own defence. This geopolitical reality has forced European leaders to acknowledge that relying on US support is no longer a guaranteed strategy, accelerating discussions on independent military capabilities and funding mechanisms.

Why is European defence spending rising?

For decades, the US has outspent Europe on defence, contributing more than two-thirds of NATO's¹ overall budget. However, NATO estimates that in 2024, 23 out of 32 members met the 2% GDP² defence spending target, compared to just seven members in 2022 and three in 2014³. More ambitious goals are being discussed. Poland is leading the way with a 4.12% of GDP² defence budget, while discussions at NATO suggest some countries may need to increase spending to 3% or higher¹.

Adding another layer of complexity is the US Department of Government Efficiency (DOGE) initiative, which is beginning to reshape US defence priorities. The shift from cost-plus to fixed-price contracts under DOGE is putting financial pressure on defence companies most exposed to the US, which may see constraints on long-term spending commitments. This could have two contrasting effects: while it may limit US capability to fund

European defence through NATO, it could also drive European nations to increase domestic procurement and reduce dependency on US defence systems.

Additionally, emerging security threats, including cyber warfare, artificial intelligence (AI)-driven military technology, and the growing presence of authoritarian regimes, have reinforced the need for increased defence investments. Europe's reliance on outdated Cold War-era military equipment is another critical factor, pushing leaders to modernise their arsenals.

How will Europe fund its defence expansion?

Ramping up defence spending is a monumental task, especially given high sovereign debt levels across Europe. Yet, leaders are exploring creative solutions to secure the necessary funding. One approach is to reallocate existing European Union (EU) budgets, with discussions centring on repurposing unspent Cohesion Funds and Recovery and Resilience Facility (RRF) loans. However, legal restrictions within EU treaties may limit their direct application to military expenditures.

Another potential route is the issuance of European Defence Bonds, mirroring the successful NextGenerationEU pandemic recovery fund. By pooling resources at the EU level, this could offer a coordinated and cost-effective funding mechanism.

At the same time, private investment and public-private partnerships are gaining traction. Defence contractors and institutional investors are increasingly seen as strategic partners in financing large-scale projects, particularly in weapons systems, cyber defence, and artificial intelligence. Governments may leverage these collaborations to accelerate procurement and technological advancements.

Despite these options, one thing is clear—Europe must find a sustainable funding model to support its defence ambitions without derailing economic stability. Whether through EU-level financing, national budget reallocations, or private-sector involvement, securing long-term defence investment will be paramount in ensuring Europe's security and strategic autonomy.

Impact on defence stocks: can the strong run continue?

European defence stocks have had a strong run since 2022, driven by surging order books, government contracts, and the realisation that military spending is no longer optional. Over the past year, Europe

defence stocks rose 40.8%, outpacing broader European equities (+11.4%)⁴. Defence stocks trade at a historical P/E⁵ ratio of ~14x, slightly above the long-term average, though still below peak multiples⁶

There are three key trends fuelling defence stock momentum:

- **Backlogs at record highs:** European defence contractors are sitting on unprecedented order books, with consensus forecasting 2024-29 CAGRs⁷ of ~11% for sales and ~16% for both adjusted EBIT⁸ and adjusted EPS⁹. These growth rates compare to just 8%, 11% and 12%, respectively, for the 2019-24 period¹⁰.

- **Government commitments:** with long-term contracts locked in and additional spending likely, demand visibility remains strong.
- **EU's push for strategic autonomy:** The European Commission has proposed a European Defence Industrial Strategy (EDIS), aimed at spending at least 50% of procurement budgets within the EU by 2030 and 60% by 2035¹¹.

Conclusion: a new era for European defence

The European defence sector is entering a new era of investment and strategic autonomy. With rising geopolitical risks and uncertainty over US support, European nations are taking proactive steps to build a more robust and self-sufficient military ecosystem. While funding challenges persist, the momentum behind higher budgets, technological investments, and NATO commitments makes this shift not just necessary, but inevitable.

With the EU backing structural shifts in procurement, defence stocks remain well-positioned, particularly those with exposure to land (for example, ammunition, vehicles) and air (for example, air defence, missiles, drones) domains.
