

# Gold outlook - gold to flatline out to June 2019 in the absence of shocks

Published 7 June 2018

## Nitesh Shah

Head of Commodities and Macroeconomic Research, WisdomTree Europe

Although the environment of elevated geopolitical risk is normally associated with higher gold prices, recently very little of that anxiety has been expressed in gold. Gold is being weighed lower by a rising interest rate environment in the US. An appreciation of the US Dollar (up 1.6% over the past month) is also weighing on the yellow metal's performance. Given the soft patch of economic data from Europe and Japan, interest rates are likely to diverge between the US and other countries, leading to further dollar appreciation and negative gold price pressure.

Looking ahead, we believe gold's price is likely to flatline until mid-2019, unless unexpected shock events result in a sudden drive towards safe-haven assets.

Recently, we updated our forecasts for gold, using the framework first described in the report "[Policy mistakes provide upside potential for gold](#)", published in January 2016. For a detailed description of the new forecasts, please [click here](#). Below we present a summary of our new base, bull and bear case gold price forecasts.

In our base-case scenario, gold is likely to flatline out to the end of June 2019, ending the period at a price of \$1,307/oz, close to gold's price of \$1,294/oz gold, at the time of writing.

We assume that the US Federal Reserve (Fed) is on track to raise to interest rates at least four times by the end of June 2019. In our base-case scenario for gold, inflation is likely to remain above-target, providing some support for the precious metal, yet rising interest rates and US dollar appreciation will weigh on performance. Our base case also assumes that we see no unexpected shock events between now and mid-2019.

## Figure 1: Gold price forecast

In our bull-case scenario, gold could rise to \$1,613/oz by the middle of 2019.

Our bull-case scenario assumes that the Fed is more relaxed about inflationary pressures, extrapolating this period of tight market conditions without wage and inflationary repercussions. Treasury yields decline in this scenario. We also revert to the consensus view of the US dollar depreciating.

- Gold markets incorporate a number of geopolitical risk including:
- Continued tension between US/Japan/South Korea and North Korea
- An escalation of the proxy war between Saudi Arabia and Iran, with Iran withdrawing from the Joint Comprehensive Plan of Action (JCPOC) and resuming its nuclear programme
- A disorderly unwinding of credit in China
- Italian policy paralysis as a result of the country's inability to form a functional government
- Market volatility, with the VIX (equity) or MOVE (bonds) indices spiking as yield trades unwind

In our bear-case scenario, gold falls to \$1,166/oz by June 2019.

Our bear case assumes that the Fed becomes more aggressive in tackling inflationary pressures. In this scenario, the Fed tries to anchor inflation expectations amid rising headline figures that it fears could be mistaken as persistent. 10-year nominal Treasury yields rise and the US Dollar appreciates more aggressively.

## Conclusion

Our model suggests that gold's price is influenced by a number of key factors, including the value of the US dollar, inflation rates, changes in nominal yields, and investor sentiment towards the precious metal. Looking ahead, in our base-case scenario, we expect gold's price to flatline out to June 2019, assuming an absence of sudden unexpected events that shock global financial markets. However, should events turn out differently and some of the geopolitical concerns crystallise into an adverse shock, gold could trade substantially higher. Thus, with gold currently trading at US\$1294/oz at the time of writing, investors concerned about adverse geopolitical shocks may have found a good entry point.
