

Time to glean profits from grains

Published 5 June 2018

The 2018 price gains staged by wheat, corn and soybeans of 18%, 14% and 6% respectively (as of 18 May 2018), display a turnaround in the grains market that has, in the recent past, been plagued by weak prices due to rising inventories. In its first outlook for the 2018/19 (September/August) cycle, released on 10 May 2018, the US Department of Agriculture (USDA) was optimistic in its outlook for the grains market and this positive tone has recently been resonated in the futures market, with speculative positioning rising to its highest level since August 2017, according to commodity and futures trading commission data. Here's a closer look at key agricultural commodity projections and the implications for investors.

Corn deficit

Based on USDA's projections, the decline in world corn ending stocks puts the world stocks-to-usage ratio at 14.5%, compared to 21.8% last year. This would mark the second-tightest world stocks-to-usage ratio for corn since the 1973/74 season, rendering the new corn crop vulnerable to adverse weather conditions. Corn prices are trading at historically low levels relative to the stocks-to-usage ratio and given that corn prices are known to exhibit the most pronounced negative correlation (0.55) to the stocks-to-usage ratio among all grains, we expect to see a significant catch up in corn prices, similar to that witnessed in 2010. However, as corn enters the prime growing season of June to September, it remains exposed to significant price pressure.

Soybean plantings to exceed corn plantings

Low agricultural commodity prices are resulting in a paradigm shift in the US towards increased production of soybeans in lieu of resource-intensive corn and wheat. USDA expects soybean plantings to exceed corn plantings in 2018 by the greatest level ever. Despite USDA projecting global soybean production to rise on the back of a recovery from the drought in Argentina, higher soybean crush and exports are expected to offset most of the rise, with global soybean ending stock estimates declining by 5.5 million tons.

After the announcement of punitive tariffs on US soybean imports by China, China's 2018/19 soybean imports are projected to decline for the first time in 15 years. At the same time, China's soybean acreage is set to be expanded by around 9%, according to sources from the Chinese Ministry of Agriculture. While this will contribute to production, China will only be producing approximately 12% of the amount of soybeans it consumes. Considering China's rising soybean demand, we do not expect the current developments to interfere with the country's import requirements and expect to see a resolution to the ongoing trade disputes.

Tough conditions for winter wheat

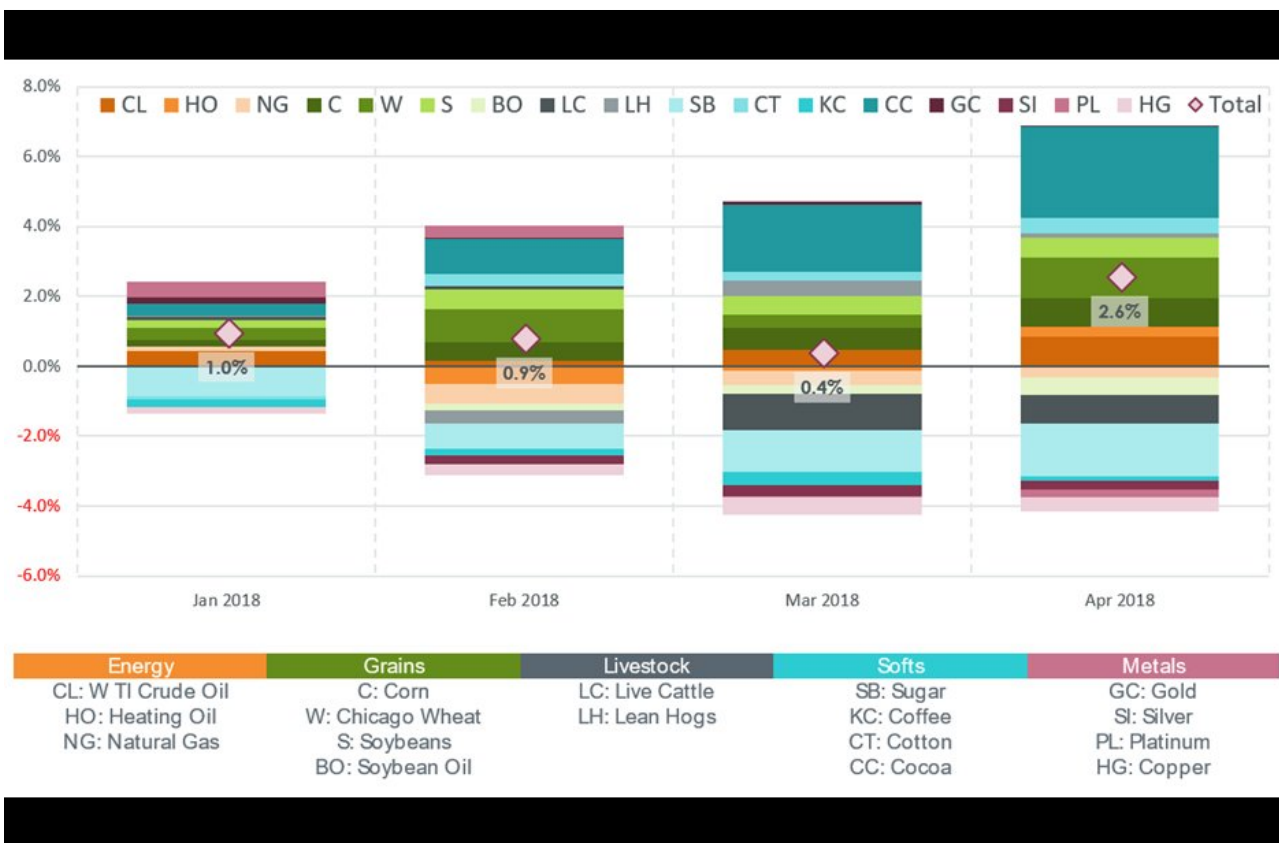

Wheat remained the weak link in USDA's latest report. Since the start of 2018, a large part of wheat's upward price momentum can be attributed to reports of tough conditions for winter wheat crop in Kansas, the most important US growing state, and other key regions. As it stands, 50% of Kansas winter wheat, 68% of Oklahoma winter wheat and 60% of Texas winter wheat is in poor or very poor condition. Planting progress shows winter wheat was 36% headed, falling behind the five-year average pace of 41%. However, USDA surprised investors by projecting a 5% increase in US wheat production due to a strong rise in spring wheat, despite poor winter wheat conditions.

Despite the 15% decline projected for Russian wheat crop, global wheat stocks are expected to be only 2% short of the 2017/18 all-time high. However, world ending stocks for 2018/19 are estimated to be lower at 955 million bushels, a positive development, which if realised would mark a four-year low.

How to gain exposure to agricultural commodities

Due to the strong performance of the grains market in 2018, the Continuous Commodity Futures Price Index (CCI Index), which has a high allocation to grains and agricultural commodities (47%), has risen 3.27% (as of 18 May 2018).

Figure 4: Cumulative contribution to spot return - year to date

Source: USDA, Bloomberg, ETFSecurities. Past performance is not indicative of future results. You cannot invest directly in an Index.

Positive contributors to the spot return this year have been energy, grains and cocoa, as per the chart. For investors looking to gain exposure to grains and agricultural commodities, the CCI Index offers diversified exposure to commodities while maintaining a tilt to grain and agricultural commodities.
