

# IEA's bullish outlook for electric vehicles and what it means for investors

Published June 1, 2023

Director, Research

*“A new clean energy economy is emerging, and it is emerging much faster than many stakeholders, policymakers, industry players, and investors think today” – Fatih Birol, Executive Director, IEA during the Global EV Outlook 2023 press event on 26 April 2023.*

The International Energy Agency (IEA) published its Global Electric Vehicle Outlook for 2023 on 26 April. Its assessment of the state of the industry is encouraging and its projections for the industry's growth are exciting. Electrification of road transportation is the disruptive innovation the industry has been waiting for. It appears that the tipping point has been reached.

## Highlights from 2022, and developments in 2023

Electric vehicle (EV) sales exceeded 10 million in 2022 (see Figure 1). This amounts to 14% of all new cars sold in 2022, up from 9% in 2021, and less than 5% in 2020. This trend has continued at the start of 2023 with over 2.3m EVs sold in the first quarter, 25% more than the same period last year. By the end of the year, sales could hit 14 million with an acceleration expected in the second half of the year<sup>1</sup>.

China remains the dominant market, accounting for around 60% of global electric car sales last year, with Europe and the United States following behind. Nonetheless, there are promising signs of growth in emerging markets such as India, Thailand, and Indonesia where sales of electric cars last year more than tripled compared to 2021.

**Historical performance is not an indication of future performance and any investments may go down in value.**

## The key tailwinds

Policy support for the adoption of electric vehicles has never been stronger and it continues to strengthen. The European Union has set out CO2 standards for cars and vans aligned with 2030 goals set out in the Fit for 55 package. In the US, the Inflation Reduction Act (IRA), and California's Advanced Clean Cars II rule could accelerate the journey to 50% EV market share by 2030<sup>2</sup>.

Given strong support from policymakers and adoption from consumers, innovation in battery manufacturing also appears to have been catalysed. While it is a given that battery chemistries will continue to

evolve and greater levels of efficiency will be achieved, developments along the way, such as CATL's recent condensed battery launch, are noteworthy and encouraging.

On 19 April 2023, the Chinese battery manufacturer CATL, among the biggest names in the industry worldwide, unveiled a high-energy density, so-called 'condensed battery' at Auto Shanghai. CATL claims that this battery could not only meaningfully increase the range of EV batteries but could also help electrify passenger aircraft. Admittedly, there are multiple unknowns in CATL's claims, including costs and delivery times, but it highlights how battery manufacturers are focused on achieving new degrees of efficiency.

Growing competition and, therefore, more choice for consumers is also facilitating the adoption of EVs. The number of electric car models worldwide exceeded 500 in 2022, more than double compared to 2018. While this is still significantly lower than the number of internal combustion engine (ICE) models on the market, this proliferation of models is increasing competition among original equipment manufacturers (OEMs) which should help bring costs down.

Electrification, however, is going beyond passenger cars. In 2022, over half of India's three-wheeler registrations were electric. Similarly, electric light commercial vehicle sales worldwide increased by more than 90% in 2022 compared to the year before<sup>4</sup>. Such encouraging growth is also being witnessed in other market segments like electric heavy-duty trucks and buses.

### **The forecast**

Even in the IEA's stated policies scenario (STEPS – a conservative scenario which only factors in existing policies), growth of electric vehicles is expected to be strong this decade (see Figure 2). Across the globe, countries are swiftly introducing bans on the sale of new ICE vehicles. Some countries, like Norway, have taken the lead by making this ban effective from 2025. For many other countries, the bans come into effect between 2030 and 2040. Collectively, therefore, it is reasonable to expect a meaningful uptick in EV sales as we progress towards those deadlines.

### **Forecasts are not an indicator of future performance and any investments are subject to risks and uncertainties.**

One of the biggest hurdles in EV adoption is the availability of ample public charging infrastructure. Fortunately, charging infrastructure is developing quickly, albeit at different rates in different countries. Overall, however, the IEA have an optimistic view on the number of publicly available charging points worldwide by 2030.

## A renewed focus on the supply chain

According to the IEA, automotive lithium-ion (Li-ion) battery demand increased by about 65% to 550 gigawatt hours (GWh) in 2022, from about 330 GWh in 2021, primarily because of growth in electric passenger car sales. In 2022, about 60% of lithium, 30% of cobalt, and 10% of nickel demand was for EV batteries. Only five years prior, these shares were around 15%, 10% and 2%, respectively.

Electric vehicles are not only driving demand for batteries, but also the underlying commodities. For investors, this means a holistic view of automotive and battery value chains is warranted when considering the electrification megatrend. For example, China holds a dominant position in both value chains and its role in terms of where it sits within the value chain is evolving rapidly. China is the biggest manufacturer of batteries worldwide but is also quickly establishing itself in the segment of car companies (OEMs) with the emergence of brands like BYD.

But as competition increases, more regulation is introduced, and further innovation happens, supply chains will develop. Some links may get broken while others get formed. All in all, an exciting time to be following this space.
