

# Amidst the frenzy for Nvidia, don't forget the data centres

Published 6 July 2023

Will 2023 be the 'year of artificial intelligence'? It's looking quite possible.

Whenever a singular topic gains this level of attention, it's instructive to look at how investors develop different types of tunnel vision. If the wave continues, there is a good chance that the general person may not know what a graphics processing unit (GPU) is, or how it connects to artificial intelligence (AI), but they may know that Nvidia makes them and that Nvidia is the 'AI company'.

Frequently, we find ourselves trying to step back and think about the broader set of infrastructure that is required for Nvidia's GPUs to be effective at training and running AI models. Nvidia designs merely one part of a much longer value chain that builds into the AI ecosystem. It is an important part, and Nvidia is able to extract a significant percentage of the overall economic value. But, if the other parts ceased to exist, Nvidia's GPUs by themselves are not very useful.

## **Data centres: where are the AI models trained and run?**

The software aspect of AI is often conceptualised, but it's important not to forget the physical aspect. Giant server farms, strategically deployed across the globe, allow the internet to work as we have come to expect, and this compute infrastructure also allows the largest AI models to be trained and run.

Data centres represent the specific, purpose-built real estate that supports this compute infrastructure. There is a constant race to both expand the computational resourcing per square foot in the existing data centres as well as the overall data centre footprint.

Why is this? Well, when was the last time you thought about data storage? We're all taking more pictures, generating more content and not paying a second's thought to storage. We just assume that when we need it, more will always be there.

At WisdomTree, we work closely with CenterSquare, an investment management firm that specialises in real estate assets. They recently put out a short briefing note with a focus on data centres.

Figure 1 provides important context on what the current real estate market looks like, halfway through 2023:

- Data centres represent 8.6% of the pie.
- Many people would have expected the share of 'Office' to be larger, but it was only 2.9%.

- We'd also draw attention to 'Towers' at 13.8%. A critical reason to discuss data centres and AI regards the speed with which we can send data to different places. Cell phone towers and the overall upgrade to 5G infrastructure is an important link in this chain.

**Figure 1: A snapshot of the current real estate market [US real estate investment trust (REIT) investable universe]**

**Historical performance is not an indication of future performance and any investments may go down in value.**

Figure 2 takes the two largest data centre real estate investment trusts (REITs), Digital Realty Trust and Equinix, and looks at the percentage of annualised rental revenue from 'cloud/IT providers'. The reason CenterSquare wanted to highlight this was from the recognition that it is really these companies that are driving AI, and equity markets, forward. Some of the names would include:

- Amazon.com
- Alphabet
- Apple
- Meta Platforms
- Microsoft
- IBM
- Oracle

If we look at market indices, like the S&P 500 Index or the Nasdaq 100 Index, many of these firms are responsible for the bulk of the performance observed in the first half of 2023. Whether or not that exact trend continues, it's clear that investors believe that these companies will be central in pushing AI forward. Figure 2 indicates how important these firms are to the revenues from the two largest data centre REITS.

**Historical performance is not an indication of future performance and any investments may go down in value.**

Figure 3 addresses the fact that, for the hyperscale (that is, most capable, best compute infrastructure), cloud providers depend on Equinix and Digital Realty Trust for the majority of their connectivity. It is a similar idea to considering a key trend in semiconductors, where many firms depend on Taiwan Semiconductor Manufacturing Co. (TSMC) to fabricate the most advanced chips. Space and prime locations for data centres are not unlimited and, even if the degree of specialisation is not the same as the case of TSMC, there are benefits to these companies being able to plug into existing infrastructure from firms that specialise in exactly that, as opposed to building each and every data centre on their own.

### **Figure 3: The hyperscale cloud providers have a major reliance on Equinix and Digital Realty Trust**

*Source: CenterSquare compiled available data from cloud provider websites as of December 2022 and also from Equinix as of 8 May 2023 to create this image.*

Figures should be noted as estimates based on the best available public data. Subject to change.

### **Bottom line: new economy real estate represents an alternative way to think about artificial intelligence in 2023**

If we start looking under the hood at how certain stocks, like Equinix and Digital Realty Trust, have performed, we see in Figure 4 that they have not moved to anywhere near the same extent as other stocks associated with AI during the first half of 2023. On the one hand, we'd note that there is no reason to expect them to move as much as companies like Nvidia, a 'picks and shovels' AI play, or a Meta Platforms, an example of a firm building large language models. But we'd also say that the function that they provide does become more valuable if we know we need to dramatically expand computational resources and infrastructure.

The CenterSquare New Economy Real Estate UCITS Net Total Return Index represents a broad array of 'technology oriented real estate opportunities'. It does have exposure to data centre REITS, and it also has exposure to cell phone tower REITS. Computational resources need to be placed somewhere, and data needs to be transmitted if we are going to see the dramatic expansion of AI that we expect. Finally, we see how that Index compares to that of the FTSE Nareit All Equity REITs Net Tax Index, a way to look even more broadly at publicly investable real estate assets.

In the first half of 2023, many investors went to the picks and shovels. If AI continues to expand in its importance, where might it go next?
