

# A new ingredient in the Bloomberg Commodity Index

Published 29 January 2026

**Tobias Lazar**

Associate Director, Quantitative Research

## Key Takeaways

- Cocoa is added in the 2026 rebalance, becoming a small, production-weighted component of the index.
- Performance-driven overweights from 2025 are reversed, reinforcing the index's rules-based discipline.
- Broad, production-weighted exposure supports inflation sensitivity for investors focused on maintaining purchasing power.
- Implementation choices can influence outcomes, particularly in strong commodity markets and for precious metals, where physical replication is feasible.

The average European eats around 6 kilograms of chocolate every year<sup>1</sup>. Recent spikes in cocoa bean prices have fed directly into prices on the shelves around the world, offering a clear example of how agricultural supply shocks translate into consumer inflation.

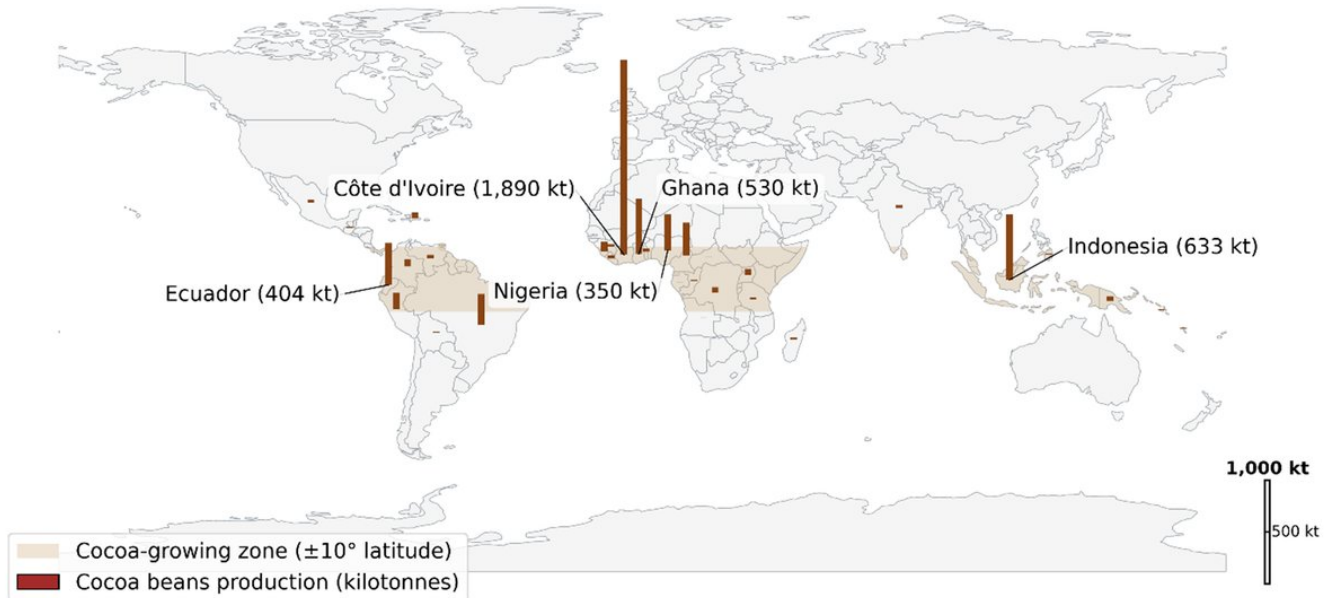

In the 2026 annual rebalancing, Bloomberg has included cocoa bean futures in its widely followed Bloomberg Commodity Index (BCOM). The index's methodology aims to capture commodities that represent key real-economy inputs, with weights determined by global production and futures market liquidity.

Cocoa enters the index with a target weight of approximately 1.7%. At the same time, precious metals weights are being reset following strong relative performance in 2025, with target weights in 2026 close to those of 2025. Similarly, energy commodities, including Brent and WTI crude, return to weight levels seen at the beginning of 2025.

## A bean under pressure

Cocoa production is highly concentrated, with the majority of global supply originating from a small number of countries within a narrow equatorial belt, most notably Côte d'Ivoire and Ghana (Figure 1). The geographic concentration makes global supply particularly sensitive to regional disruptions.

## Figure 1: Geographic concentration of cocoa bean production

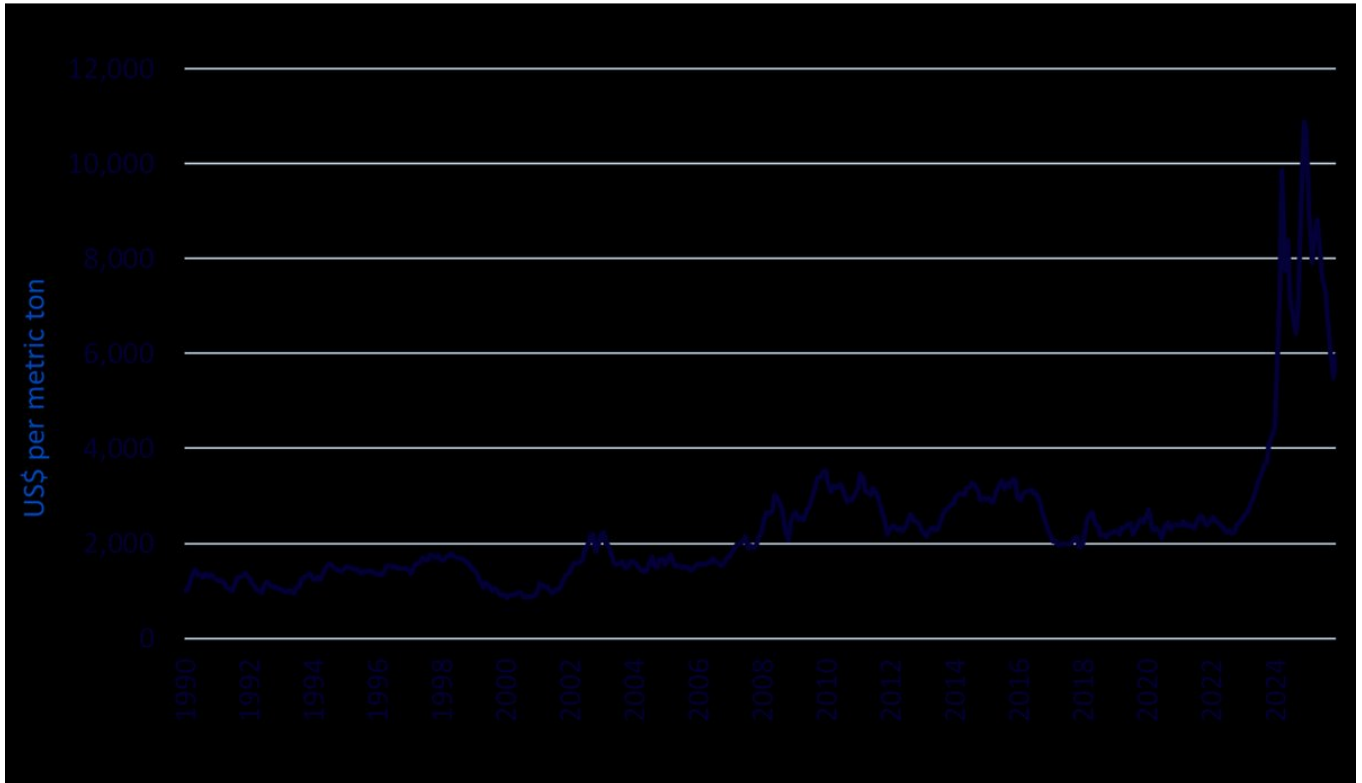

Source: Food and Agriculture Organization of the United Nations, WisdomTree. Production numbers in kilotonnes as of 2024.

In recent years, cocoa yields have come under sustained pressure from adverse weather patterns, the spread of plant disease, ageing tree stock, and prolonged underinvestment at the farm level. These factors have constrained supply growth at a time when demand has remained resilient<sup>2</sup>.

The result has been a sharp increase in price volatility and a series of pronounced price spikes (Figure 3).

## Figure 2: Cocoa prices amid constrained supply conditions

## Reversing performance-driven overweights

Alongside the addition of cocoa beans, the most visible impact of the 2026 rebalancing is the reversal of the performance-driven weight concentration that accumulated over 2025 (Table 1). In determining the annual target commodity weights, the index relies on liquidity data and US dollar-weighted production data, rather than recent price performance.

Following the strong 2025 returns for gold (+62.46%) and silver (+138.63%), the weight of precious metals increased from approximately 19% to 29% over the course of the year. As the target weights for 2026 do not materially differ from those of 2025, the index's rules-based rebalancing process reduces precious metals exposure back to its production-based allocation.

Energy commodities, which broadly declined in 2025 (-10.41%), see the opposite effect. In line with the same methodology, allocations to Brent and WTI crude increase relative to year-end weightings, reflecting their underlying economic footprint rather than recent returns.

## Table 1: The 2026 target weights of the Bloomberg Commodity Index

Group	Commodity	2025 Target Weight	2025 Total Return	Weight 31 December 2025	2026 Target Weight	2026 target weight vs year-end weight
Energy	Brent Crude Oil	8.03%	6.79%	5.53%	8.36%	2.83%
Energy	Natural Gas	7.78%	23.86%	7.00%	7.20%	0.20%

## Benchmark composition matters for inflation hedging

Commodities have historically exhibited a high sensitivity to inflation, reflecting their role as direct inputs into food, energy, and manufactured goods (Figure 3). As such, broad commodity benchmarks are commonly used within multi-asset portfolios seeking to preserve purchasing power.

However, the effectiveness of a commodity allocation as an inflation hedge depends not only on asset class exposure, but also on the representation of different commodities. Concentration in a small number of commodities or sectors can reduce alignment with the sources of inflation consumers experience.

By maintaining diversified exposure across energy, metals and agricultural commodities, and by systematically rebalancing weights based on economic production rather than price performance, broad benchmarks such as the Bloomberg Commodity Index are designed to remain aligned with inflation pressures as they emerge across the real economy.

## Figure 3: Commodity prices and inflation

Source: Bloomberg, from December 1960 to September 2025. Historical performance is not an indication of future performance, and any investments may go down in value. **Forecasts are not an indicator of future performance and any investments are subject to risks and uncertainties.**

The addition of cocoa futures marginally broadens the index's exposure to food-related price pressures. Food and beverages account for a meaningful share of consumer inflation baskets, making agricultural commodities an important, though often smaller, component of inflation-sensitive portfolios.

## Implementation choices in strong commodity markets

2025 was a strong year for commodities, outperforming many traditional and alternative assets (Figure 4). Precious metals were among the strongest-performing commodity segments, supported by falling real yields, sustained central bank demand for gold and periods of heightened policy and geopolitical uncertainty.

### Figure 4: 2025 returns of major asset classes

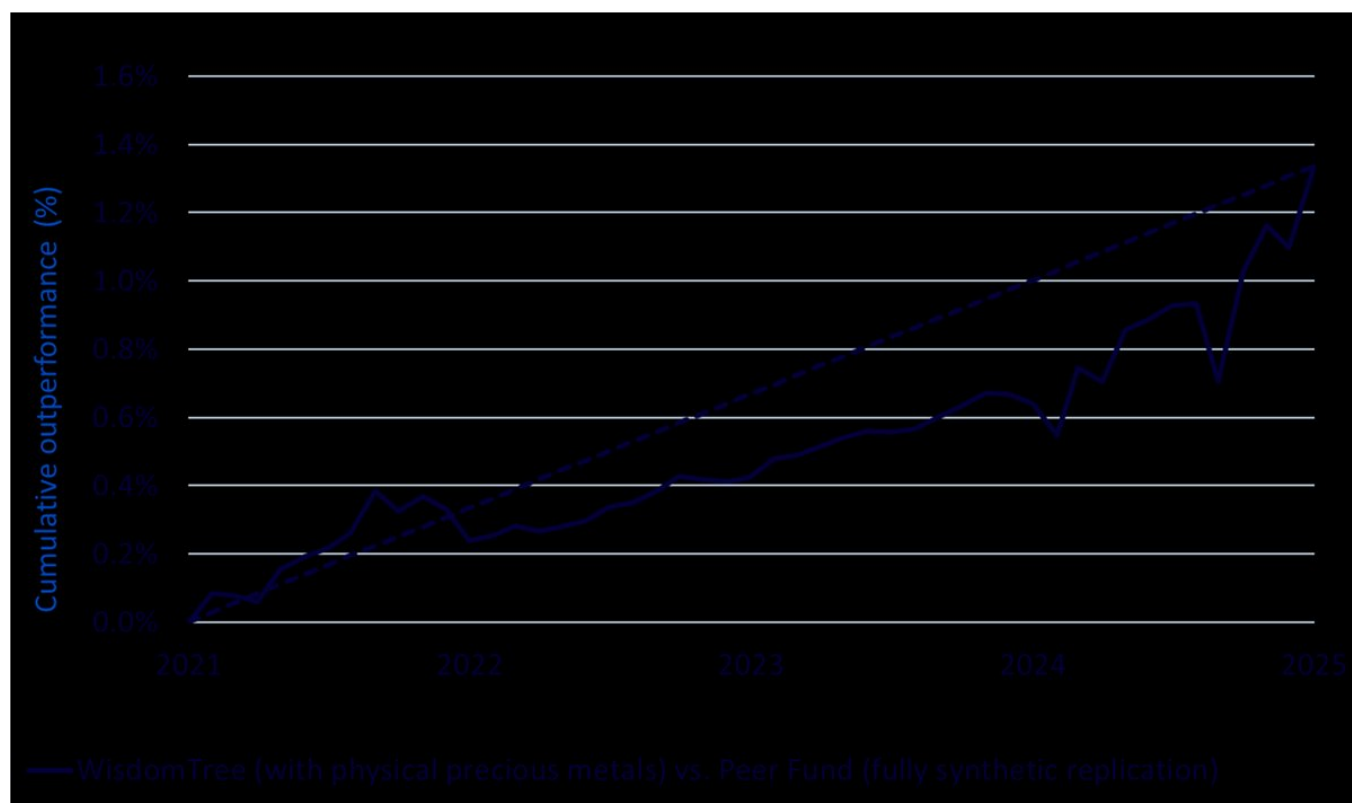

Source: Bloomberg, from 31 December 2024 to 31 December 2025 in USD, as total return. 'Global Equities' is the MSCI ACWI Gross Total Return USD Index, 'Global Fixed Income' is the Bloomberg Global-Aggregate Total Return Index Value Unhedged USD, 'Digital Assets' is the CoinDesk 20 Index, and 'Global Real Estate' is the FTSE EPRA Nareit Global REITs TR Index. **Historical performance is not an indication of future performance, and any investments may go down in value.**

Strong performance can amplify differences between benchmark exposure and implementation. While indices define economic exposure, the way that exposure is delivered can influence outcomes. Broad commodity ETFs typically rely on futures-based replication, which is often the only feasible approach for bulky or perishable commodities, but can introduce roll costs over time.

Where physical replication is possible, such as for precious metals like gold and silver, holding the underlying metal in physical form can affect performance (Figure 5). The WisdomTree Bloomberg Commodity UCITS ETF (PCOM) combines futures-based exposure with physically backed precious metals, reflecting how many investors access gold and silver individually. Over time, this implementation approach has contributed to performance differences relative to fully synthetic peers.

## Figure 5: Performance comparison of PCOM and a fully synthetic broad commodity ETF

Source: WisdomTree, Bloomberg, from 31 December 2021 to 31 December 2025. The timeseries shows the difference in cumulative return of net asset values of the WisdomTree Broad Commodities UCITS ETF and a peer ETF tracking the same index in US Dollar. The dashed line visualises the historical trend as a linear function. **Historical performance is not an indication of future performance, and any investments may go down in value.**

## Key takeaways

The 2026 rebalancing of the Bloomberg Commodity Index demonstrates how a rules-based benchmark adjusts to changing market conditions through a consistent and transparent process. The inclusion of cocoa futures reflects observable developments in agricultural markets, while the reduction of performance-driven overweights shows the index's focus on economically grounded exposures.

Beyond benchmark construction, the way commodity exposure is implemented can also matter, particularly during periods of strong market performance. Differences between futures-based and physical replication, especially in precious metals, can influence realised outcomes over time.

Taken together, these considerations highlight the importance of both index design and implementation in maintaining representative exposure to real-economy inputs and managing concentration across market cycles.
