

Factor Diversification and Why It Matters in a New Market Regime

Published May 13, 2020

Scott Welch, CIMA®

Chief Investment Officer, Model Portfolios

Most investment professionals are familiar with “asset allocation performance quilts,” which summarize how different global asset classes perform relative to each other over different time periods. Here is a recent example from JP Morgan Asset Management, showing historical performance through the end of 2019:

You cannot invest directly in an index.

For definitions of terms in the chart, please visit our [glossary](#).

The well-intentioned point of these “performance quilts” is to illustrate how difficult it is to predict which asset classes will perform best at any given time, thereby highlighting the importance of asset class diversification within a portfolio (the light gray boxes labeled “Asset Alloc.” in the above chart).

But is asset class diversification sufficient for building more robust portfolios? We think it is a necessary condition, but investors and advisors can build better portfolios by also considering risk factor diversification.

Asset classes—or, more specifically, the securities that fall within a given asset class—can be thought of (somewhat simplistically) as convenient little bundles of specific risk factors. Because of this, however, seemingly diversified asset class portfolios do not always deliver the expected level of protection during disruptive markets (as we are witnessing firsthand right now)—they are often exposed to similar or comparable risk factors.

Consider the simple example of large-cap U.S. stocks, emerging markets (EM) stocks and high-yield bonds. These are all very different asset classes, but they all have highly correlated risk factor profiles. (Specifically, they are all heavily influenced by the equity risk factor.)

So when a disruptive market event occurs, they tend to fall together. The logical conclusion of this avenue of thought is that better diversification might be achieved by allocating across *risk factors* as well as across *asset classes*.

A “risk factor performance quilt,” similar to the more familiar “asset class quilt” and incorporating a variety of the risk factors embedded in different WisdomTree ETFs, looks like this:

2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	YTD (3/31)

Source: Bloomberg, as of 3/31/20. The starting universe for the referenced “factor portfolios” consists of the 800 largest companies listed in the U.S. Securities in the Low Correlation portfolio are selected based on their trailing 6- and 12-month correlation versus the broad market. Securities in the Low Volatility portfolio are selected based on their trailing 12-month standard deviation. Securities in the Momentum portfolio are selected based on their trailing 6- and 12-month risk-adjusted performance. Securities in the Quality portfolio are selected based on stronger current and historical (three-year) measures of profitability compared to their peers in the same GICS industry using four main variables: return on equity, return on assets, gross profits over assets and cash flow over assets. Securities in the Value portfolio are selected based on more attractive valuation metrics compared to their peers in the same GICS industry using six main variables: sales-to-price, book-to-price, earnings-to-price, estimated earnings-to-price, EBITDA-to-enterprise value and operating cash flow-to-price. Securities in the Size portfolio are selected based on their market capitalization compared to their peers in the starting universe. Securities in the Multifactor portfolio are selected based on a composite score calculated by equally weighting their low correlation, momentum, quality and value scores.

Just focusing on the “swirling” color pattern alone illustrates that risk factors, like asset classes, rotate in and out of favor, and that more diversified risk factor exposures may build in the potential for more consistent performance.

As we have discussed, [we believe asset allocation model portfolios will increase in importance, especially in the wake of this terrible coronavirus pandemic](#). First, we believe that many advisors will want to rethink their approaches to both investing and running their practices, and model portfolios can help with both. Second, we also believe, despite our [continued optimism that this terrible time will pass](#), that the 10-year “perpetual beta rally” in the global markets may have come to an end, and we now are entering a new and much more volatile (some might say “normal”) market regime.

This is why [WisdomTree Model Portfolios](#) are diversified at both the asset class and risk factor levels. It is also an important reason why all our models are “open architecture” and include non-WisdomTree products. We believe this allows us to build diversified risk factor exposures that optimize the potential for delivering on our investment mandates in a robust, more consistent fashion.

Risk factor diversification is not yet a “household phrase” in the investment management industry, at least not to the same extent as *asset class diversification*. But, given the rapid evolution of factor-based solutions, including WisdomTree Model Portfolios and ETFs, combined with what we believe will be a new, much more volatile market regime going forward, we anticipate a dramatic increase in awareness and adoption.
